

Multi-Network SIM

Building on the success of our home network SIM which provides low latency, low-cost connectivity and over 97% UK coverage, our new dual-IMSI SIM provides automatic failover to one of three alternative UK mobile Radio Access Networks in the unlikely event of our home network not being available, increasing coverage to 99%.

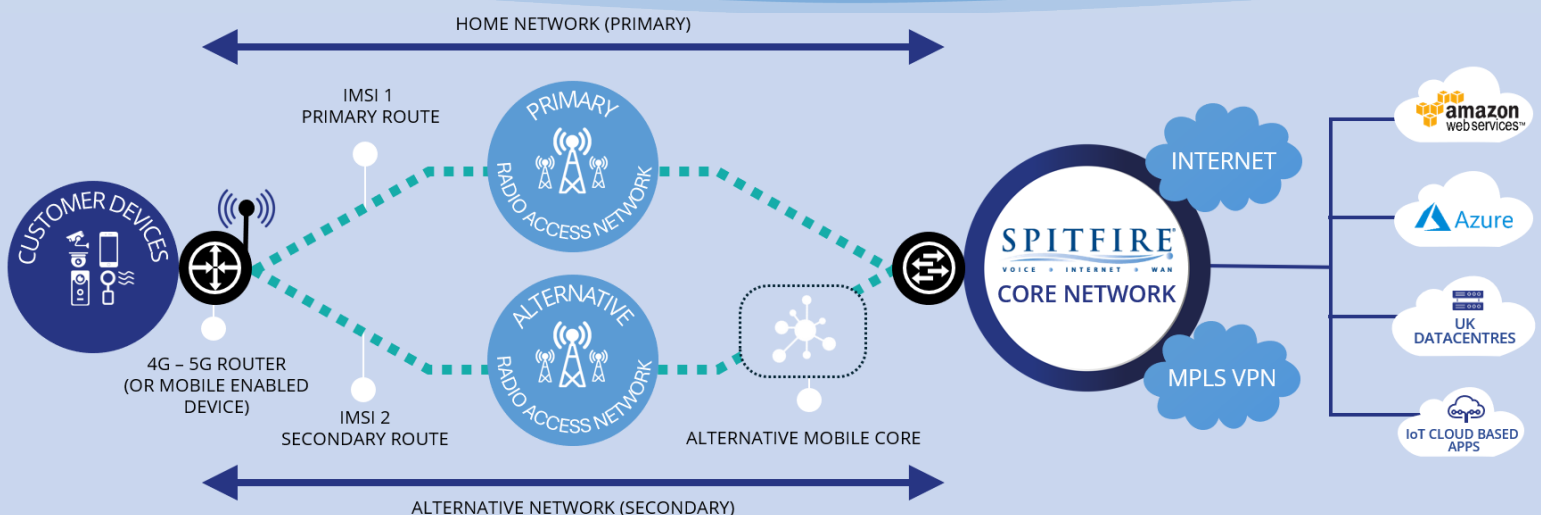

This provides unrivalled network availability – the ideal choice for business-critical devices, or in areas with variable network coverage.

Key Features of Spitfire's Multi-Network SIM

- 99% coverage across the UK*
- Enhanced resiliency, keeping you connected
- Seamless failover to one of three alternative UK mobile Radio Access Networks
- Dual IMSI profiles with the same IP configuration for seamless failover
- Connects to One Network
- MPLS/Private APN networks available
- Simple network and SIM estate management via an online portal
- Flexible pricing models available to meet your exact needs

*Ofcom report - Connected Nations Update: Spring 2022

What Makes Spitfire's Multi-Network SIM Different?

Spitfire's Multi-Network SIM uses dual IMSI profiles for robust connectivity. The primary profile optimises cost and latency by prioritising our home network, while the secondary profile ensures seamless failover to one of three alternative UK mobile Radio Access Networks when the primary network is unavailable. This design makes Spitfire Multi-Network SIMs the ideal choice where your IoT solution is critical, where network coverage is variable, or where devices are on the move between areas serviced by different network providers.

These SIMs offer flexible pricing options and customisable configurations, including fixed public IP addressing schemes which are replicated across both IMSI profiles for easy management, as well as the option for private APNs.

Multi-Network SIM - Key Benefits

COVERAGE

Over 97% UK coverage through our home network, backed up by three alternative UK mobile Radio Access Networks to always keep you connected, taking this to 99%

RESILIENCY

Seamless failover between primary and secondary IMSI profiles, utilising different networks to mitigate against service disruption

MOBILITY

Connect to any of the four UK mobile Radio Access Networks while on the move

SECURITY

Whichever mobile operator your SIM connects to, you can opt for all data to stay on-net within Spitfire's One Network. Secure and private network making your devices invisible to external threats

Why Spitfire?

Secure & Private Connectivity

Collaboration

Management & Control

Extensive range of products & services

One stop provider for all connectivity needs

Award-winning UK based customer support team

Experienced Account Managers with professional qualifications

We don't ask our partners to commit to any quotas or targets

Access to extensive online portals & resources
